Disclaimer Notice
In accordance with the manufacturer’s policy of continual product improvement, the product presented in this brochure is subject to change without notice or obligation.

The material in this manual is believed adequate for the intended use of the product. If the product is used for purposes other than those specified herein, confirmation of validity and suitability must be obtained. Eclipse warrants that the product itself does not infringe upon any United States patents. No further warranty is expressed or implied.

Liability & Warranty
We have made every effort to make this manual as accurate and complete as possible. Should you find errors or omissions, please bring them to our attention so that we may correct them. In this way we hope to improve our product documentation for the benefit of our customers. Please send your corrections and comments to our Marketing Communications Manager.

It must be understood that Eclipse’s liability for its product, whether due to breach of warranty, negligence, strict liability, or otherwise is limited to the furnishing of replacement parts and Eclipse will not be liable for any other injury, loss, damage or expenses, whether direct or consequential, including but not limited to loss of use, income, or damage to material arising in connection with the sale, installation, use of, inability to use, or the repair or replacement of Eclipse’s products.

Any operation expressly prohibited in this manual, any adjustment, or assembly procedures not recommended or authorized in these instructions shall void the warranty.

Document Conventions
There are several special symbols in this document. You must know their meaning and importance.

The explanation of these symbols follows below. Please read it thoroughly.

How To Get Help
If you need help, contact your local Eclipse representative. You can also contact Eclipse at:
1665 Elmwood Rd.
Rockford, Illinois 61103 U.S.A.
Phone: 815-877-3031
Fax: 815-877-3336
http://www.eclipsenet.com

Please have the information on the product label available when contacting the factory so we may better serve you.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

Is used to address practices not related to personal injury.

Indicates an important part of text. Read thoroughly.

Product Description

The ThermThief is a nozzle-mixing burner designed for tube firing applications with multiple fuel capability. The burner consists of a housing, rear cover, air and fuel inlet blocks, spark rod, flame rod (if selected), gas tube, nozzle and air shroud.

Burner design provides:
- Adjustable air shroud to maintain correct air velocity for different sized tube applications and fuels.
- Uniform tube temperatures for extending tube life.

Heat Exchanger

The ThermThief can be used with or without an exhaust leg recuperator. An exhaust leg recuperator is a heat exchanger that transfers heat from the exhaust air to the combustion air. Preheating the combustion air can increase the fuel efficiency by as much as 20%. The ThermThief can handle combustion air temperatures up to 1000°F. The recommended recuperators for the ThermThief are the Eclipse Bayonet (Data 317) and the Bayonet-Ultra (Spec. 318).

Audience

This manual has been written for people who are already familiar with all aspects of a nozzle-mix burner and its add-on components, also referred to as “the burner system”.

These aspects are:
- Installation
- Use
- Maintenance

The audience is expected to have previous experience with this type of equipment.

TFB Documents

Installation Guide No. 310
- This document

Datasheet, Series No. 310-1 through 310-3
- Available for individual TFB models
- Required to complete installation

Design Guide No. 310
- Used with Datasheet to complete installation

Worksheet No. 310
- Required to provide application information to Eclipse Engineering

Related Documents
- EFE 825 (Combustion Engineering Guide)
- Eclipse Bulletins and Info Guides: 610, 710, 720, 730, 742, 744, 760, 930, I-354

Purpose

The purpose of this manual is to ensure that you carry out the installation of a safe, effective, and trouble free combustion system.
Important notices about safe burner operation will be found in this section. Read this entire manual before attempting to start the system. If any part of the information in this manual is not understood, contact Eclipse before continuing.

**Safety Warnings**

- **DANGER**
  - The burners covered in this manual are designed to mix fuel with air and burn the resulting mixture. All fuel burning devices are capable of producing fires and explosions when improperly applied, installed, adjusted, controlled or maintained.
  
  - Do not bypass any safety feature. Fires and explosions can be caused.
  
  - Never try to light the burner if the burner shows signs of damage or malfunctioning.
  
- **WARNING**
  - The burner might have HOT surfaces. Always wear protective clothing when approaching the burner.

- **NOTICE**
  - This manual provides information in the use of these burners for their specific design purpose. Do not deviate from any instructions or application limits described herein without written advice from Eclipse.

**Capabilities**

Adjustment, maintenance and troubleshooting of the mechanical and the electrical parts of this system should be done by qualified personnel with good mechanical aptitude and experience with combustion equipment.

**Operator Training**

The best safety precaution is an alert and trained operator. Train new operators thoroughly and have them demonstrate an adequate understanding of the equipment and its operation. A regular retraining schedule should be administered to ensure operators maintain a high degree of proficiency.

**Replacement Parts**

Order replacement parts from Eclipse only. All Eclipse approved, customer supplied valves or switches should carry UL, FM, CSA, CGA, and/or CE approval, where applicable.
In this section you will find the information and instructions that you need to install the burner and recommended accessories.

**NOTE:** Most of the illustrations in this chapter are based on a TFB 30, but are typical for all ThermThief burners. Where necessary, customized illustrations are used to describe specific details.

**Handling**
- Make sure that the area is clean.
- Protect the components from the weather, damage, dirt and moisture.
- Protect the components from excessive temperatures and humidity.
- Take care not to drop or damage components.

**Storage**
- Make sure that the components are clean and free of damage.
- Store the components in a cool, clean, dry room.
- After you have made sure that everything is present and in good condition, keep the components in the original package as long as possible.

**Position of Components**
The position and amount of components are determined by the kind of control method chosen. All the control methods can be found in Design Guide 310. Use the schematics in the System Design section to build your system.

**Approval of Components**

**Limit Controls & Safety Equipment**

All limit controls and safety equipment must comply with all applicable local codes and/or standards and must be listed for combustion safety by an independent testing agency. Typical application examples include:

- **American:** NFPA 86 with listing marks from UL, FM, CSA
- **European:** EN 746-2 with CE mark from TuV, Gastec, Advantica

**Electrical Wiring**

All the electrical wiring must comply with all applicable local codes and/or standards such as:

- NFPA Standard 70
- IEC60364
- CSA C22
- BS7671

**Gas Piping**

All the gas piping must comply with all applicable local codes and/or standards such as:

- NFPA Standard 54
- ANSI Z223
- EN 746-2

**Where to Get the Standards:**

**The NFPA Standards are available from:**
National Fire Protection Agency
Batterymarch Park
Quincy, MA 02269

Checklist Before Installation

Intake
To admit fresh combustion air from outdoors, provide an opening in the room of at least one square inch per 4,000 BTU/hr. If there are corrosive fumes or materials in the air, then supply the burner with clean air from an uncontaminated area.

Exhaust
Do not allow exhaust to accumulate in the work area. Provide some positive means for exhausting them from the furnace and the building.

Access
Make sure that you install the system in such a way that the burners and components are easily accessible for inspection and maintenance.

Environment
Make sure the local environment matches the original operating specifications. Check the following items:

- Voltage, frequency and stability of the electrical power
- Type and supply pressure of the fuel
- Availability of enough fresh, clean combustion air
- Humidity, altitude and temperature of air
- Presence of damaging corrosive gases in the air

Prepare the Burner

Burners are calibrated at the factory. However, adjustments may be necessary for your particular application. If re-calibration is required, follow the instructions that follow:

Step 1: Adjust the Nozzle

Figure 3.1. Nozzle Adjustment

General Information
The distance between the end of the air tube and the end of the nozzle, dimension A, is very important. If dimension A is not correct, burners may not operate properly. Based on the information provided in Table 3.1 or Table 3.2, verify that dimension A is correct for your operating conditions. If adjustment is necessary, follow the instructions on page 7, “Adjust the Nozzle”.

Find Dimension A
Dimension A is different for each fuel type, tube diameter and burner size.
- For the TFB 30 and TFB 75; use Table 3.1
- For the TFB 200; use Table 3.2

| Table 3.1 Dimension A Inches (mm) for TFB 30 & TFB 75 |
|---------------------------------|-------|-------|-------|-------|
| Fuel                         | 50 - 150 | 150 - 350 | 350 - 500 | 500 - 750 |
| Natural Gas                  | 0.251 (6.4) | 0.374 (9.5) | 0.500 (12.7) | 0.625 (15.9) |
| Propane                      | 0.125 (3.2) | 0.251 (6.4) | 0.374 (9.5) | 0.500 (12.7) |
| Butane                       | 0.125 (3.2) | 0.125 (3.2) | 0.251 (6.4) | 0.374 (9.5) |

| Table 3.2 Dimension A Inches (mm) for TFB 200 |
|---------------------------------|-------|-------|
| Fuel                         | 500 - 1000 | 1000 - 2000 |
| Natural Gas                  | 0.500 (12.7) | 0.625 (15.9) |
| Propane                      | 0.374 (9.5) | 0.500 (12.7) |
| Butane                       | 0.251 (6.4) | 0.374 (9.5) |

Adjust the Nozzle

NOTE: Place burner on a suitable working surface.

1. Remove the ignition rod (3) or (3a) and flamerod (3) if applicable.
2. Remove the four bolts (1).

3. Pull the rear cover (2) far enough away from the housing (4) to get access to the lock nut (5).

4. Loosen the lock nut (5).

5. Push the assembly back together.

6. Hold the rear cover (2) in position and screw the nozzle in or out to adjust dimension A. See Figure 3.1.

7. Carefully pull the rear cover (2) and nozzle assembly out of the housing (4).

8. Turn the nozzle (6) over the shortest distance until the opening (7) in the nozzle for the ignition rod (3) aligns with the appropriate opening in the rear cover (2).

9. Make sure that the nozzle (6) does not move and tighten the lock nut (5).

10. Reinstall ignition rod (3) or (3a) and flamerod (3) if used.

11. The disk end of the ignition rod and flamerod should be approximately 3/8" past the face of the nozzle (6).

12. The rods are adjustable at the threaded end of the rod.

13. Tighten the compression nut on the rods after positioning.

14. Assemble the burner:
   a. Install the rear cover (2) to the housing (4) at the relative position that you need to match the pipe work.
   b. Install the four bolts (1).

15. Reconnect the piping.

Step 2: Install the UV Scanner (if required)

1. Look through the peepsight (1) and make sure that it aligns with the UV port in the nozzle.

2. Remove the peepsight (1).

**CAUTION**

- If combustion air is preheated, the UV Scanner must be protected from high temperatures. Install the UV Scanner with a heat block seal and supply cooling air. See Bulletin 834.

3. Install the UV scanner onto a short pipe with external 1/2" NPT threaded into the burner and with appropriate thread for the scanner. When using a flame safeguard other than recommended in the Design Guide, it may be necessary to use adaptor part #10033. This adaptor has a small orifice and will ensure the UV Scanner does not detect the ignition.
spark. Burner turndown may be affected by using the adaptor.

4. Install the UV Scanner, and if necessary the heat block seal, in opening (1).

5. Make sure that the center peepsight (2) is installed.

6. Make sure the UV scanner is connected to the electrical circuit of that burner.

**DANGER**

- Gas will leak if the center peepsight is not installed.
- Connecting the flame sensor of a burner to the electrical circuit of the wrong burner can cause fires and explosions.

The UV scanner must be compatible to the flame monitoring control that is used. Refer to the manual of your selected control for proper selection of the scanner.

**NOTICE**

- Adjustments may vary from Eclipse published values if the flame controls other than those recommended in the Design Guide are used. Consult with the engineer who specified the alternate control for limitations.

**Burner Installation**

**Figure 3.7. Install the Burner**

**Step 1: Install the Burner**

**Dimensions**

For full information on the burner dimensions, refer to the appropriate Datasheet: 310-1 (TFB 30); 310-2 (TFB 75); 310-3 (TFB 200).

The burner will bolt to the tube flange. Align the air and gas to accommodate accepted piping practices.

**Straight Run of Pipe Before a Metering Orifice**

**NOTE:** There must be a straight run of pipe at least 10 pipe diameters before the burner metering orifice. Failure to provide this distance will result in inaccurate pressure drop readings, and possibly poor burner performance.

**Pipe Connections**

- Install a pipe union in the line to each burner. This simplifies removal of the burner.
- The use of flexible pipe nipples in the air and gas lines to the burner is optional.
- Flexible pipe nipples may cause higher pressure drops than equivalent standard pipes, an additional consideration when sizing air lines.

**Avoid Large Pressure Drops**

**NOTE:** The pressure drop of the gas and the air in the piping is a critical parameter. Ensure that the size of all the piping is large enough to prevent excessive pressure loses and that the number of elbows is kept to a minimum.

If using a recuperator, pressure drops increase with the air temperature. For the effects of the temperature on the pressure drop, refer to the Combustion Engineering Guide (EFE 825).

**Install the Recuperator**

**Figure 3.8. Install the Recuperator**

In radiant tube applications, ThermThief burners can be used in conjunction with an exhaust leg recuperator.

- Insulate hot air piping and portion of recuperator shown shaded in the schematic above with “Moist PAK-D” by Fiberfrax, Eclipse part #57325.
- **DO NOT INSULATE THE BURNER.**
- The use of flexible nipples in hot air piping is strongly recommended to account for thermal expansion.
Step 2: Valve Installation

Valve Orientation
Install all the valves in such a way that the arrow (if present) on the valve body points in the direction of flow.

Figure 3.9. Valve Orientation

Gas Cocks
Make sure that the handle of a gas cock is at a right angle to the valve body when the valve is in the closed position. This is an important position indicator. If you do not do this, somebody may think that the gas cock is in the closed position, while it is actually in the open position.

Gas Balancing Valves
A gas balancing valve is typically the same as a manual butterfly valve. Refer to section below.

Manual Butterfly Valves
2. Install manual butterfly valves in the gas line to the burner (optional).

NOTE: It is recommended that there is a run of pipe with a length of at least 10 pipe diameters between any flow altering device and metering orifice on the burner.

Automatic Butterfly Valve
An automatic butterfly is driven by an actuator. Install the control valve in accordance with Bulletin/Info Guide 720.

Ratio Regulator
- Connect an impulse line to the ratio regulator from air supply line.
- Install the ratio regulator in accordance with Bulletin/Info Guide 742.

Figure 3.10. Valves

Step 3: Install the Flame Monitoring System

Refer to the System Schematic in Design Guide 310 for the control methodology used. A detailed explanation of components can be found in the appendix.

Checklist After Installation
To verify proper system installation, do the following:

1. Ensure that there are no leaks in the gas lines and the air lines.
2. Ensure all the components of the flame monitoring control system are properly installed. This includes verifying that all switches are installed in correct locations and all wiring, pressure and impulse lines are properly connected.
3. Ensure components of spark ignition system are installed and functioning properly.
4. Ensure that the blower rotates in the correct direction. If incorrect, then have a qualified electrician rewire the blower to reverse its rotation.
5. Ensure all valves are installed in proper location and correctly oriented relative to the gas or air flow.

Prepare for Adjustment
After installation of the burner system components are complete, the following steps should be followed in order to prepare for adjustment:

1. Set the air pressure switch so that it drops out at 4” w.c. (10 mbar) below the pressure rating of the blower.
2. Set the low gas pressure switch at 4” w.c. (10 mbar) below the gas pressure measured at the inlet to the main gas valve train.
3. Set the high gas pressure switch so that it comes on at 4” w.c. (10 mbar) above the gas pressure measured at the inlet to the main gas valve train.
4. Close all the burner gas cocks or pressure taps.
5. Try to light a burner before the purge and other timers have finished their cycle. Make sure that the flame monitoring system indicates a flame failure.
6. Trip out pressure switches and other limit interlocks. Make sure that the main gas valve train interlocks.

- If simulated limits or simulated flame failures do not shut down the fuel system within the required failure response time, immediately correct the problem before proceeding.
In this chapter you will find instructions on how to adjust a system, and how to start and stop a system.

**DANGER**

- Do not bypass any safety feature. You can cause fires and explosions.

**Adjustment**

**Step 1: Reset the System**

1. Close the automatic gas valves and gas cocks.

2. Fully open the manual air butterfly valve at each burner.
   a. Drive the automatic zone air control valve to high fire.
   b. Adjust the automatic zone air control valve so that it is fully open.

3. Start the blower.

**NOTICE**

- Make sure that the blower rotates in the correct direction. If incorrect, have a qualified electrician rewire the blower to reverse its rotation.

**Step 2: Set High Fire Air**

1. Make sure that the system is at high fire.
2. Set high fire air.

The following sets apply to an ambient air system with orifice plates installed:

Use the air curve of the datasheet for your particular burner to find the air pressure differential that you need at high fire. This is now your target value for high fire.

**NOTE:** A pressure tap is open when the screw inside the tap is unscrewed approximately half a turn.

**Figure 4.1. Reset the System**

1. Close the automatic gas valves and gas cocks.

2. Fully open the manual air butterfly valve at each burner.
   a. Drive the automatic zone air control valve to high fire.
   b. Adjust the automatic zone air control valve so that it is fully open.

3. Start the blower.

**Figure 4.2. Set High Fire Air**

a. Make sure that pressure tap A and pressure tap B of the burner are open. (Open the internal screw 1/2 turn.)

b. Connect the manometer to tap A and tap B of the burner (across the air orifice). Make sure that the hose completely covers the side vents on pressure tap.

c. Adjust the manual zone air butterfly valve until the high fire air pressure differential is at the target value. Make sure that the manual butterfly valves at every burner are fully open.

d. Measure and note the air pressure differential for all other burners in the zone.

e. If all the measured differential pressures are within 0.3" w.c. of each other, then proceed to the next section. If the variation is greater than 0.3" w.c., then it will be necessary to adjust the manual air
butterfly valve at each burner to improve the balance.

**CAUTION**

- Make sure that all the pressure taps are closed.
- Verify the required input levels. Firing at higher levels will reduce tube life or even destroy tubes.

The following steps apply to a preheated air system with recuperator, and with no orifice plates installed:

Use ambient “Static Air Pressures” on page 14 to find the static air pressure that you need at high fire. This is now your target value for high fire.

1. Make sure that pressure tap A of the first burner is open.
2. Adjust the zone air manual butterfly valve until the high fire air pressure is at the target value.
3. Measure and note the static air pressure for all other burners in the zone.
4. If all the measured differential pressures are within 0.3" w.c. of each other, then proceed to the next section. If the variation is greater than 0.3" w.c., then it will be necessary to adjust the manual air butterfly valve at each burner to improve the balance.

**CAUTION**

- Make sure that all the pressure taps are closed.

**Step 3: Set Low Fire Air**

The following steps apply to an ambient air system with orifice plates installed:

1. Set the system to low fire.
2. Choose one burner in the zone. Connect the manometer to tap A and tap B of the burner (across the air orifice).
3. Adjust the automatic zone air control valve until the low fire air pressure differential is 0.2" w.c. This is your initial setting only. Further adjustment may be required.
4. Repeat step 2 and 3 for the other zones (if any).

The following steps apply to a preheated air system with recuperator, and with no orifice plates installed:

1. Set the system to low fire.
2. Choose one burner in the zone. Connect the manometer to tap A.

3. Adjust the automatic zone air control valve until the low fire static air pressure is:
   - 0.05" w.c. for the TFB 30
   - 0.2" w.c. for the TFB 75 and TFB 200
4. This is your initial setting only. Further adjustment may be required.
5. Repeat steps 2 and 3 for the other zones (if any).

**Step 4: Verify the Air Settings**

Make sure that all the settings are still the same after cycling the system several times between high fire and low fire.

**Step 5: Ignite the Burners**

**Manual Ignition Steps:**

1. Drive the zone air automatic control valve to low fire.
2. Make sure the combustion blower is running.
3. Set the manual gas butterfly valve at each burner to 50% open.

**DANGER**

- Do not touch the ignition plug or the ignition wire when the ignition is on. You will get a shock.
7. While viewing down the peepsight, open the gas cock at burner. Burner should ignite.

8. If burner does not ignite within 20 seconds, close gas cock and purge with air. Repeat steps 6 - 8 without any adjustment to ensure all air is purged from the gas piping.

9. If burner still does not ignite adjust an additional 1/2 turn down on ratio regulator.

10. Repeat steps 6 - 9 if necessary.

11. Repeat steps 6 - 10 for all other burners in the zone.

Automatic Ignition Steps:
1. Drive the zone air automatic control valve to low fire.
2. Make sure the combustion air blower is running.
3. Set the manual gas butterfly valve at each burner to 50% open. See Figure 4.3.
4. Set the adjusting screw on the ratio regulator 6 full rotations of 360° down from the top (initial setting).
5. Open the zone manual gas cock.
6. Open the manual gas cock at each burner.
7. Initiate the ignition sequence through the flame monitoring system.
8. Check that all the burners in the zone have ignited.
   • If a gas solenoid valve is fitted at each burner, then repeat step 7 for all burners in the zone.
   • If burners do not light, purge with air and adjust an additional 1/2 turn down on the ratio regulator. Repeat step 7.

   NOTE: Initially it may be necessary to repeat step 7 two or three times to purge all the air out of the gas pipework.

9. If all the burners have ignited, then drive the zone air butterfly valve to high fire. Make sure that the burners stay ignited.

Step 6: Set High Fire Gas
1. Use the gas curves on the appropriate datasheet to find the gas pressure differential needed at high fire. This is the target value for high fire.

   NOTE: A pressure tap is open when the screw inside the tap is unscrewed approximately half a turn.

   2. Make sure that pressure tap C and pressure tap D of the burner are open (open the internal screw 1/2 turn).
   3. Connect the manometer to tap C and tap D of the burner (across the gas orifice).
   4. Measure the high fire gas pressure drop for the first burner.
   5. Adjust the manual gas butterfly valve at the burner until the gas flow is at the target value.
   6. Repeat step 4 and step 5 for the other burners in the zone (if any).
   7. Check the gas pressure at the inlet to the zone ratio regulator. This should be at least 5” w.c. higher than the loading line pressure. It should not exceed the maximum pressure rating of the ratio regulator.
   8. Measure the oxygen level in the exhaust, using an oxygen analyzer.
   9. If the O₂ level is between 2.5% and 4%, the level is correct. If not, adjust the manual gas butterfly valve until you have the appropriate level.
   10. Repeat steps 2 through step 9 for the other burners.
   11. For each burner, connect the manometer across pressure taps C and D and measure the pressure drop.
      • If all pressure drops are at or below the target value, then the settings are correct.
      • If necessary, adjust the manual zone air butterfly valve to obtain the target value.
   12. Verify settings when the furnace is at operating temperature.

CAUTION

- Make sure that all the pressure taps are closed.
Step 7: Verify the Gas Settings

1. Make sure that all the settings are still the same after you cycle the system several times between high fire and low fire.

2. When all settings have been completed, mark the position of the indicator on each butterfly valve to indicate valve position. This will save time later.

DANGER

■ Make sure that you close all the pressure taps after you remove the manometer. Gas that leaks from the pressure taps can cause fires and explosions.

Step 8: Adjust Low Fire

1. Drive the system to low fire.

2. If a burner goes out, close gas cocks. Go to Step 5 “Ignite the Burners” on page 12, and follow instructions.

3. Adjust the ratio regulator until the O₂ level is between 10% and 14%.

   If the oxygen levels are between 10% and 14%, but the temperature continues to rise above the desired level:

4. Reduce low fire air flow by adjusting the zone air control valve linkage. Recheck oxygen levels at low and high fire.

5. If necessary, repeat step 3.

Start Procedure

DANGER

■ If a burner does not light, and the system does not shut down automatically, then you must close the main gas cock. An uncontrolled flow of gas can cause fires and explosions.

■ Do not touch the ignition plug or the ignition wire when the ignition is on. You will get a shock.

Manual Ignition

1. Make sure the gas cock at each burner is closed.

2. Start air blower.

3. Drive the automatic zone air control valve to low fire.

4. Start ignition transformers.

   5. Open the gas cock at each burner checking to ensure that the burner lights.

Automatic Ignition

1. Start the blower.

2. Open all the gas cocks.

3. Start the ignition sequence.

4. Verify that flame is present at each burner.

If a burner does not light and:

• The system does not shut down automatically: Close the main gas cock manually. Do NOT operate the system. Go to “Checklist After Installation” on page 10. Repeat the start procedure.

• The system shuts down automatically: See “Troubleshooting” on page 17.

Stop Procedure

1. Close the following valves:

   • The manual gas cock at the main control valve
   • The manual gas cock for each burner or zone

2. Let the burners cool down. Keep the blower on until the chamber temperature is less than 1000°F (500°C) and then stop the blower.

NOTICE

■ Keeping the blower on after the burner is off protects the burner and the other components from hot gases that flow back through the burner.

Static Air Pressures

When a burner uses preheated combustion air, there are no air orifices installed. In that case, the static air pressure is used to set the initial air flow of a burner. From there on the burner is further adjusted.
Maintenance & Troubleshooting

This chapter is divided into two sections:

- Maintenance procedures
- Troubleshooting guide

**Maintenance**

Preventive maintenance is the key to a reliable, safe and efficient system. The core of any preventive maintenance system is a list of periodic tasks.

The following are suggestions for a monthly list and a yearly list.

**NOTE**: The monthly list and yearly lists are an average interval. If the environment is dirty, the intervals may be shorter.

**Monthly Checklist**

1. Inspect flame sensing devices for good conditions, cleanliness.
2. Check for proper inlet air/gas ratios.
3. Test all the alarm systems for proper signals.
4. Check ignition rod for damage or distortion.
5. Check valve motors and control valves for free, smooth action and adjustment.
6. Measure and record the high fire oxygen levels in the exhaust every month. If there is any change, find the cause and correct it.
7. View down the peepsights on the burners and down the exhaust legs of the tubes to check for unusual flame or carbon build-up. If necessary, remove the burner to investigate.

**Yearly Checklist**

1. Test interlock sequence of all safety equipment. Manually make each interlock fail, noting that related equipment closes or stops as specified by the manufacturer.
2. Test (leak test) safety shut-off valves for tightness of closure.
3. Test main fuel hand valves for operation.
4. Test pressure switch settings by checking switch movements against pressure settings and comparing with actual impulse pressure.
5. Visually check ignition cable and connectors.
6. Inspect impulse piping for leaks.
7. Remove and inspect all the burners. Clean off any carbon build up.
8. Make sure that the following components are not damaged or distorted.
   - The burner nozzle
   - The ignition rods
   - The flame tube

If applicable, remove and clean all the orifice plates.
### Troubleshooting Procedures

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start-up sequence runs but does not light, no ignition</td>
<td>There is no power to the ignition transformer.</td>
<td>Restore the power to the ignition transformer.</td>
</tr>
<tr>
<td></td>
<td>Open circuit between the ignition transformer and the ignition rod.</td>
<td>Repair or replace the wiring to the ignition rod.</td>
</tr>
<tr>
<td></td>
<td>The ignition rod needs cleaning.</td>
<td>Clean the ignition rod.</td>
</tr>
<tr>
<td></td>
<td>The ignition rod is not correctly grounded to the burner.</td>
<td>Clean the threads of the ignition rod and the burner. Do not use pipe sealant on ignition plug threads.</td>
</tr>
<tr>
<td></td>
<td>The ignition rod is grounded to the nozzle or the air shroud.</td>
<td>Check the ignition rod position.</td>
</tr>
<tr>
<td></td>
<td>The ignition and flame rod wiring is reversed.</td>
<td>Correct wiring.</td>
</tr>
<tr>
<td>Start-up sequence runs but does not light, not enough gas</td>
<td>There is air in the gas line.</td>
<td>Repeat the start attempt several times.</td>
</tr>
<tr>
<td></td>
<td>The gas pressure into the ratio regulator is too low.</td>
<td>Measure the gas pressure into the ratio regulator and adjust gas pressure if necessary. (See “Adjustment, Start &amp; Stop” section)</td>
</tr>
<tr>
<td></td>
<td>The impulse line to the ratio regulator is leaking.</td>
<td>Repair any leaks.</td>
</tr>
<tr>
<td></td>
<td>Start gas solenoid valve does not open (if fitted).</td>
<td>Check wiring to the valve. Check output from the flame safeguard. Check solenoid valve coil for proper operation. Replace if necessary.</td>
</tr>
<tr>
<td></td>
<td>Manual gas valve closed.</td>
<td>Open the gas valve.</td>
</tr>
<tr>
<td>Start-up sequence runs but does not light, too much gas</td>
<td>Gas pressure out of ratio regulator is too high.</td>
<td>Check adjustments. If necessary, remove regulator and investigate.</td>
</tr>
<tr>
<td>Start-up sequence runs but does not light, poor ignition</td>
<td>Incorrect type of flame safety, must have ignition during all the trail for ignition.</td>
<td>Change flame monitoring equipment.</td>
</tr>
<tr>
<td></td>
<td>Wrong type of ignition transformer.</td>
<td>Use correct type.</td>
</tr>
<tr>
<td>Start-up sequence runs but does not light</td>
<td>Improper air/gas settings.</td>
<td>Check pressure and settings and adjust as necessary.</td>
</tr>
<tr>
<td>Start-up sequence runs but does not light, insufficient flame signal</td>
<td>Flamerod or UV scanner needs cleaning.</td>
<td>Clean the flamerod or UV scanner lens.</td>
</tr>
<tr>
<td></td>
<td>Flamerod is grounded to nozzle.</td>
<td>Adjust position so ceramic insulation contacts nozzle.</td>
</tr>
<tr>
<td></td>
<td>Flamerod and spark rod reversed.</td>
<td>Reposition spark plug or flamerod.</td>
</tr>
<tr>
<td>Start-up sequence runs but does not light, improper air/gas ratio</td>
<td>Air in the gas line.</td>
<td>Repeat start-up several times.</td>
</tr>
<tr>
<td></td>
<td>Ratio regulator incorrectly set.</td>
<td>Adjust to proper setting.</td>
</tr>
<tr>
<td>The low fire flame is weak or unstable</td>
<td>Not enough gas.</td>
<td>Readjust gas flow at ratio regulator.</td>
</tr>
<tr>
<td></td>
<td>Not enough air.</td>
<td>Open automatic valve slightly.</td>
</tr>
<tr>
<td>Problem</td>
<td>Possible Cause</td>
<td>Solution</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>--------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>The burner does not light or goes off when it cycles to high fire</td>
<td>Burner set too lean, becoming unstable as air increases.</td>
<td>Adjust the settings to provide more gas.</td>
</tr>
<tr>
<td></td>
<td>Insufficient pressure into ratio regulator.</td>
<td>Adjust the pressure settings on the main gas regulator or change spring.</td>
</tr>
<tr>
<td></td>
<td>Main gas adjustment valve not open enough.</td>
<td>Adjust the main gas adjustment valve.</td>
</tr>
<tr>
<td></td>
<td>Marginal air pressure switch setting.</td>
<td>Adjust the air pressure switch setting.</td>
</tr>
<tr>
<td></td>
<td>Gas pressure switch set incorrectly.</td>
<td>Adjust switch setting.</td>
</tr>
<tr>
<td>The burner is erratic and does not respond to adjustment</td>
<td>Internal damage to the burner, some parts inside the burner are loose, dirty or burned out.</td>
<td>Contact Eclipse.</td>
</tr>
<tr>
<td>The burner is unstable and produces soot, smoke or excessive carbon monoxide</td>
<td>The air/gas ratio is out of adjustment.</td>
<td>Reset the burner controls and clean ignition rod and UV scanner.* See “Adjustment, Start &amp; Stop” section.</td>
</tr>
<tr>
<td></td>
<td>Bleed fitting (if used) is dirty.</td>
<td>Clean fitting. Check and clean filters, ignition rod and UV scanner.* (If necessary).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>* After this step it is important that you clean the ignition rod and UV scanner, and make sure that there is no excessive soot on the nozzle. Clean where necessary.</td>
</tr>
<tr>
<td>Burner pulsates or produces noise</td>
<td>Acoustic feedback from tube.</td>
<td>Slide a piece of steel plate over the end of the tube until the rumbling disappears. Weld the plate in place. Readjust the burner controls if necessary.</td>
</tr>
<tr>
<td></td>
<td>Input inconsistent with nozzle settings.</td>
<td>Check if input is consistent with nozzle settings and adjust if necessary.</td>
</tr>
<tr>
<td></td>
<td>Too much air.</td>
<td>Check oxygen levels and adjust to 2% to 4% O₂ (at high fire).</td>
</tr>
<tr>
<td></td>
<td>Burner could be improperly set to fire at an input rate which exceeds its maximum rated capacity.</td>
<td>Check the pressure drops to verify that the inputs are at the correct levels. Reduce the input on the air and gas as required to achieve the specified inputs.</td>
</tr>
<tr>
<td></td>
<td>Negative pressure in the building.</td>
<td>In some cases, building exhaust systems create a negative pressure that “pulls” on the exhaust outlet of the tube. By placing a washer or restriction pate over the tube outlet, this suction can be equalized by burner pressure.</td>
</tr>
</tbody>
</table>

* After this step it is important that you clean the ignition rod and UV scanner, and make sure that there is no excessive soot on the nozzle. Clean where necessary.
<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cannot achieve full capacity</td>
<td>Air filter is blocked.</td>
<td>Clean the filter.</td>
</tr>
<tr>
<td></td>
<td>Gas pressure too low into the ratio regulator.</td>
<td>Adjust gas pressure.</td>
</tr>
<tr>
<td></td>
<td>Loading line pressure too low.</td>
<td>Open the zone air control valve to increase the air volume and pressure. Recheck all burner settings.</td>
</tr>
<tr>
<td></td>
<td>Adjusting valve has closed.</td>
<td>Open the valve to previous setting and check the input and flue gas settings to verify proper operations.</td>
</tr>
<tr>
<td></td>
<td>Blower is wired incorrectly.</td>
<td>A blower wired to turn backwards will produce approximately 60% of its rated capacity. Check the rotation of the blower impeller. If spinning backwards, have a qualified electrician reverse the electrical wiring.</td>
</tr>
<tr>
<td>Cannot initiate start sequence</td>
<td>Air pressure switch has not made contact.</td>
<td>Check air pressure switch adjustment. Check air filter. Check blower rotation. Check outlet pressure from blower.</td>
</tr>
<tr>
<td></td>
<td>High gas pressure switch has tripped.</td>
<td>Check incoming gas pressure. Adjust gas pressure if necessary. Check pressure switch setting and operation.</td>
</tr>
<tr>
<td></td>
<td>Low gas pressure switch has tripped.</td>
<td>Check incoming gas pressure. Adjust gas pressure if necessary. Check pressure switch setting and operation.</td>
</tr>
<tr>
<td></td>
<td>Malfunction of flame monitoring system such as shorted out flame sensor or electrical noise in the sensor line.</td>
<td>Have a qualified electrician investigate and rectify.</td>
</tr>
<tr>
<td></td>
<td>Purge cycle not completed.</td>
<td>Check flame safeguard system, or purge timer.</td>
</tr>
<tr>
<td></td>
<td>Main power is off.</td>
<td>Make sure power is on to control system.</td>
</tr>
<tr>
<td></td>
<td>No power to control unit.</td>
<td>Have a qualified electrician investigate and rectify.</td>
</tr>

Parts List Models TFB 30, 75 & 200

TFB30 & 75
A= Flamerod (30) location or spark rod (1)
B= Peepsight (8) or spark rod (1) location if flamerod is used.
C= Pipe plug (7).

TFB 200
A= Spark rod (1) only.
B= N/A
C= UV port or optional peepsight (8) location.

Optional Peepsight (TFB 30 & 75 Only, See Note)
